Chemical Equilibria

Exact Equations and Spreadsheet Programs to Solve Them

Harry L. Pardue

Concepts, procedures and programs described in this book make it possible for readers to solve both simple and complex equilibria problems quickly and easily and to visualize results in both numerical and graphical forms. They allow the user to calculate concentrations of reactants and products for both simple and complicated situations. The user can spend less time doing calculations and more time thinking about what the results mean in terms of a larger problem in which she or he may be interested.

Introduction to Macromolecular Binding Equilibria

Charles P. Woodbury

This compact, graduate-level text focuses on a key area of biophysical chemistry. Introduction to Macromolecular Binding Equilibria first describes the features of binding sites for small molecules and then presents a discussion of the formulation of binding isotherms for simple mathematical models. The book addresses special problems in describing isotherms for linear polymers and examines the complications of binding cooperativity and thermodynamic linkage interactions among multiple ligands. It highlights important aspects of experimental designs, key aspects of ligand binding to planar arrays of sites, and methods for model-free analysis data used to reveal the binding isotherm.

Understanding Molecules

Lectures on Chemistry for Physicists and Engineers

Franco Battaglia, Thomas F. George

Chemistry is a subject that many students with differing goals have to tackle. This unique general chemistry textbook is tailored to more mathematically-oriented engineering or physics students. The authors emphasize the principles underlying chemistry rather than chemistry itself and the almost encyclopedic completeness appearing in a common textbook of general chemistry is sacrificed for an emphasis to these principles. Contained within 500 pages, it is suitable for a one-semester course for students who are strong in physics and mathematics. Over 200 problems are provided to ensure understanding, and answers are provided in the text so that the students can check their progress.

Lectures on Chemistry for Physicists and Engineers

Franco Battaglia, Thomas F. George

Chemistry is a subject that many students with differing goals have to tackle. This unique general chemistry textbook is tailored to more mathematically-oriented engineering or physics students. The authors emphasize the principles underlying chemistry rather than chemistry itself and the almost encyclopedic completeness appearing in a common textbook of general chemistry is sacrificed for an emphasis to these principles. Contained within 500 pages, it is suitable for a one-semester course for students who are strong in physics and mathematics. Over 200 problems are provided to ensure understanding, and answers are provided in the text so that the students can check their progress.

Problem-Solving Exercises in Green and Sustainable Chemistry

Albert S. Matlack, Andrew P. Dicks

This book teaches students how to analyze and solve real-world problems that occur in green and sustainable chemistry. It describes situations based on events that have actually taken place and encourages creativity in finding solutions to problems that have multiple "correct" answers. The exercises and commentaries from the experienced author emphasize the reality that green chemistry is about making practical decisions and weighing multiple factors that are often conflicting, thus making it difficult or impossible to apply one perfect solution to a given problem.

Survival Guide to General Chemistry

Patrick E. McMahon, Rosemary McMahon, Bohdan Khomtchouk

This work evolved over thirty combined years of teaching general chemistry to a variety of student demographics. The focus is not to recap or review the theoretical concepts well described in the available texts. Instead, the topics and descriptions in this book make available specific, detailed step-by-step methods and procedures for solving the major types of problems in general chemistry. Explanations, instructional process sequences, solved examples and completely solved practice problems are greatly expanded, containing significantly more detail than can usually be devoted to in a comprehensive text. Many chapters also provide alternative viewpoints as an aid to understanding.

Lectures on Chemistry for Physicists and Engineers

Franco Battaglia, Thomas F. George

Chemistry is a subject that many students with differing goals have to tackle. This unique general chemistry textbook is tailored to more mathematically-oriented engineering or physics students. The authors emphasize the principles underlying chemistry rather than chemistry itself and the almost encyclopedic completeness appearing in a common textbook of general chemistry is sacrificed for an emphasis to these principles. Contained within 500 pages, it is suitable for a one-semester course for students who are strong in physics and mathematics. Over 200 problems are provided to ensure understanding, and answers are provided in the text so that the students can check their progress.

Synthesis Green Metrics

Problems, Exercises, and Solutions

John Andraos

Green chemistry promotes improved syntheses as an intellectual endeavour that can have a great impact both on preserving and utilizing our planet's finite resources and the quality of human life. This masterful accomplishment provides an evaluation of environmental impact metrics according to life cycle assessment analysis based on the Mackay compartment environmental model and Guinée environmental impact potentials formalism. Assumptions, limitations, and dealing with missing data are addressed. Best literature resources for finding key toxicological parameters are provided and applied to individual reactions as well as entire synthesis plans, in order to target molecules of interest.

Problem-Solving Exercises in Green and Sustainable Chemistry

Albert S. Matlack, Andrew P. Dicks

This book teaches students how to analyze and solve real-world problems that occur in green and sustainable chemistry. It describes situations based on events that have actually taken place and encourages creativity in finding solutions to problems that have multiple "correct" answers. The exercises and commentaries from the experienced author emphasize the reality that green chemistry is about making practical decisions and weighing multiple factors that are often conflicting, thus making it difficult or impossible to apply one perfect solution to a given problem.

Reaction Green Metrics

Problems, Exercises, and Solutions

John Andraos

This book contains a series of exercises and problems posed in the subject of green metrics. Essentially it is a "how to" book on evaluating the material efficiency, environmental impact, safety-hazard impact, and energy efficiency of any kind of chemical reaction or synthesis plan. Only the essential green metrics in each of these categories are used. The introduction highlights the hierarchy of metrics used throughout the book, explains the structure of how the book is arranged, how the problems are posed, and how the reader is to use the book. Examples refer to themes according to the headings given in the table of contents and are arranged in a hierarchical order.

Green Chemistry Laboratory Manual for General Chemistry

Sally A. Henrie

Green chemistry involves designing novel ways to create and synthesize products and implement processes that will eliminate or greatly reduce negative environmental impacts. Providing educational laboratory materials that challenge students with the customary topics found in a general chemistry laboratory manual, this lab manual enables students to see how green chemistry principles can be applied to real-world issues. Following a consistent format, each lab experiment includes objectives, prelab questions, and detailed step-by-step procedures for performing the experiments. Additional questions encourage further research about how green chemistry principles compare with traditional, more hazardous experimental methods.

Kinetics, Transport, and Structure in Hard and Soft Materials

Peter F. Green

Kinetics, Transport, and Structure in Hard and Soft Materials discusses the connection between the mechanisms of transport of atomic, or molecular entities that occur in a diverse range of materials, and structure. The text is divided into four parts. Part I discusses the fundamentals of diffusional transport (Tools), establishing the foundation for the discussions in Parts II and III on the mechanisms of transport in crystalline materials and in structurally disordered materials. Part IV analyzes phenomena such as spinodal decomposition, Mullins-Sekerka instabilities, and other types of instabilities that lead to morphological evolution facilitated by long-range collective motions of structural entities.

Organic Chemistry

A Mechanistic Approach

Penny Chaloner

This textbook classifies organic chemistry according to mechanism rather than classification of functional groups, with the intention of having students understand by means of problem solving. The emphasis is on the development of skills through a student-centered pedagogical approach. The inclusion of chromatography, spectroscopy, and spectrometry early in the book is an important concept. The book contains the customary chapters on biomolecules, but also presents chapters on industrially important processes and their economics, and environmental chemistry, areas in which every 21st-century-educated scientist should have familiarity.

A Mole of Chemistry

An Historical and Conceptual Approach to Fundamental Ideas in Chemistry

Caroline Desgranges, Jerome Delhommelle

This book is intended for students in their undergraduate years who need to learn the basics of chemistry, including science and engineering as well as humanities. This is a companion textbook which provides a unique perspective on how the main scientific concepts describing nature were discovered and, eventually, how modern chemistry was born. The book makes use of context found in history, philosophy and the arts to better understand their developments, and without using mathematical equations. The focus is then set on scientific reasoning, making this book a great companion and addition to traditional chemistry textbooks.

Thermodynamics Problem Solving in Physical Chemistry

Study Guide and Map

Kathleen E. Murphy

This innovative and unique workbook and "map" guides physical chemistry students through the decisions to be made to assess a problem situation, create appropriate solutions, and gain confidence through practice solving physical chemistry problems. The workbook includes six major sections with 20 - 30 solved problems in each section that span from easy, single objective questions to difficult, multistep analysis problems. Each section of the workbook has "key points" that highlight major features of the topic to remind students of what they need to apply to solve problems in the topic area. Consequently, the workbook and map can act as a "test" review for the students.

Connecting the Chemical Structures and Material Behaviors of Polymers

Alan E. Tonelli, Jialong Shen

The authors provide both the polymer/materials science student and practicing materials engineer a means of understanding the differences in behaviors/properties of materials made from chemically distinct polymers. This knowledge can assist them in designing polymers with chemical structures that lead to their desired material behaviors and properties. The reader will learn how the detailed chemical structures of polymers can be characterized, how their microstructural dependent conformational preferences can be evaluated, and how these conformational preferences can be connected to the behaviors and properties of their materials.

Invitation to Protein Sequence Analysis Through Probability and Information

Daniel Graham

This book explores the remarkable information correspondences and probability structures of proteins. Correspondences are pervasive in biochemistry and bioinformatics: proteins share homologies, folding patterns, and mechanisms. Probability structures are just as paramount: folded state graphics reflect Angstrom-scale maps of electron density. The author explores protein sequences (primary structures), both individually and in sets (systems) with the help of probability and information tools. This perspective will enhance the reader's knowledge of how an important class of molecules is designed and put to task in natural systems, and how we can approach class members in hands-on ways.

**Elaine A. Moore, Lesley E. Smart**

Solid State Chemistry: An Introduction presents a wide range of the synthetic and physical techniques used to prepare and characterize solids. Going beyond this, this largely nonmathematical introduction to solid state chemistry includes the bonding and electronic, magnetic, electrical and optical properties of solids. Solids of particular interest – porous solids, superconductors and nanostructures are included. Practical examples of applications and modern developments are given. It offers students the opportunity to apply their knowledge in real-life situations and serve them well throughout their degree course.

Laboratory Experiments Using Microwave Heating

Nicholas E. Leadbeater, Cynthia B. McGowan

This book presents 22 experiments encompassing organic, inorganic, and analytical chemistry performed using microwave heating, making them fast and easy to accomplish in a laboratory period. All the experiments have been tested and verified in laboratory classes. Each chapter includes an introduction to the experiment, end-of-chapter questions, and two detailed protocols for performing the reaction using a small monomode and a larger multimode microwave unit. A number of the transformations use water as a solvent for a greener, more sustainable approach, while maintaining high reaction yields.
